

DNS records for luke.sarfas.com

Please add the two records below at the DNS provider for **sarfas.com**. This points the subdomain **luke.sarfas.com** at a personal site I'm hosting on Google Firebase, and lets Firebase automatically provision and renew the SSL certificate.

Records to add

Type	Host / Name	Value	TTL
CNAME	luke	luke-sarfas-personal.web.app	3600
TXT	_acme-challenge.luke	aLfPY47L1e098NiFb8KVJaXI12xsUcyyPZhlnWaUqLg	3600

Host field — short vs. full name

Different registrars want the Host (or “Name”) field in slightly different ways:

- Most providers auto-append the zone: enter **luke** and **_acme-challenge.luke**.
- Some require the fully-qualified name: enter **luke.sarfas.com** and **_acme-challenge.luke.sarfas.com**.

Important notes

- **Do not delete the TXT record** after the site goes live. Firebase re-uses it every ~60 days to renew the SSL certificate. If it disappears, the cert eventually expires and the site will show browser security warnings.
- **If sarfas.com is on Cloudflare**, set the CNAME to **DNS only** (grey cloud), not proxied. Firebase manages its own SSL.
- If a TXT record already exists at **_acme-challenge.luke** for something else, add this as an *additional* record — DNS allows multiple TXT values on the same name.
- Propagation usually takes a few minutes to a couple of hours. Once it's live I'll get a notification on my end — no action needed from you after the records are in.

Thanks! — Luke (lukesarfas@icloud.com)
